Adobe portfolio software brings together social networking and sharing into post-processing. Instead of dragging images to a frame or collaging them together on a single Photoshop file, you can now send these images to social networks and share the collage on Facebook, Twitter and of course on your website. It also offers a feed feature, which confirms each time a specific image is tagged and shared on the network. This is a premium product, priced at \$39.99 for a standalone app. It covers a lot of features, and the website describes how to access what's covered in a four-step tutorial. Many of those features are oriented around correcting the white balance of the image. Elements users already have some of these tools (and more) through the auto white balance and auto levels features, which are also important. This program can also make color and color saturation changes, and it can help with specific contrast and sharpness, though it has its share of limitations. Another Google+ feature is a feature that's tightly integrated with the application. A Live Photo (which is included with the purchase) not only allows you to adjust your photos by accentuating color, clarity, and contrast, but by focusing on specific areas of the image. You can gradually adjust the focus while you take the photo, and the entire camera UI is there for your viewing and control. The website hosts an online tutorial that walks you through the process. The downside with Elements is that there is no way to work with raw files in-app. If you want to edit and enhance your photos in any faster way, you need a third-party application or Lightroom, which costs \$69.99 for the desktop version.

Some of our earliest use of photography was in the production of engravings ("push print") which was a subtractive process. When a photo was placed in it, you had to crop out much of the framing but had to leave it in because you were getting a picture, which meant you were getting all of the negative space. This made printing in artificial color difficult. Engravings use dyes that we could not put the colors we wanted in the white areas of the picture, so we turned these regions into black. The result was a transparency of the edge of the print."
